PRE-SEED · NOVEMBER 2026 · INDEX0 RESEARCH LABS

INDEX0

Verification before merge.

The gate that runs your tests before it says yes.

github.com/INDEX0-RESEARCH-LABS/INDEX0

status: qa_verified
exit 0
3 passed / 0 failed
sha256 9f2c…
--network none
approved
test_result
iteration 1

AI made code cheap. Proving it correct did not.

Every review layer reports on the diff. None of them run it.

- Static scanners **read the diff**, never the runtime.
- Generation and review are **sold separately**.
- Developer says done; **reviewer assumes tests ran**.

```
$ npm test

  ✗ divide rejects a zero denominator
    AssertionError: Missing expected exception

  1 failed
  — but the pull request is green
```

INDEX0

Apiiro, Sep 2025 · Veracode, Jul 2025 · Stack Overflow Developer Survey 2025

A gate, not another generator.

INDEX0 is a verification gate for AI-written code.

The gate

Every tool reports. **One gate decides** whether the patch ships.

Automated QA

Removes the reviewer's second pass: **1.6 seconds**, not an afternoon.

Modern stack

LangGraph agents inside Docker or Firecracker microVMs.

Supply side

Any model vendor competes **on your contract**, not ours.

`services/agent-orchestrator · services/sandbox-manager · infra/litellm`

Three rules, one verdict.

No dashboard to learn. No new CI to buy.

```
$ index0 verify

repository  acme/billing
suite       npm test
sandbox     firecracker

▸ architect  plan_proposal
▸ developer  implementation
▸ critic     request_changes
▸ developer  implementation
▸ critic     approve
▸ qa         3 passed / 0 failed

VERIFIED  exit 0 · 1.6 s · signed
```

Any repository with a test suite can run it.

One command in the terminal. No new CI.

Exit code zero, or the patch does not merge.

Read-only source mount · --network none · exit code 0 required for a pass

Six things that are hard to copy.

Each one came from a mistake we found in our own code.

Executes code

runs your actual suite

Seven seconds

warm cycle time

Test-edit guard

candidate cannot cheat

Sealed sandbox

no network egress

Own keys

your model contract

Signed receipts

hash-chained evidence

The guard exists because a Gemini run edited the very test that judged it.

What ships today.

Screenshots from the repository at HEAD, not a mockup.

01 · CLI

```
$ index0 verify
repo  acme/billing
suite npm test

qa    3 passed
exit  0
time  1.6 s
```

One command from any terminal.

02 · ARTIFACT

```
{
  "status": "qa_verified",
  "iterations": 1,
  "tests": {
    "passed": 3,
    "failed": 0
  },
  "exit_code": 0
}
```

Artifact carries status, tests, diff hash.

03 · DIFF

```
--- a/src/math.js
+++ b/src/math.js
 export function
   divide(n, d) {
+  if (d === 0) {
+    throw new TypeError
+  }
   return n / d;
 }
```

Replay offline without trusting the vendor.

Where the gate pays for itself.

Every one of these is a patch that looked right.

Security fixes

A fix that **compiles and still ships a CVE**.

Large refactors

A 400-file change where **“looks right” is not evidence**.

Dependency bumps

An upgrade that **breaks unopened call sites**.

AI patches

The output that is **plausible, not correct**.

Veracode 2025 GenAI Code Security Report · Stack Overflow Developer Survey 2025

What the buyer stops paying for.

Three comparisons, measured on the same repository.

THE STATUS QUO	WITH THE GATE
A second human re-read: **minutes per patch**	**1.6 seconds**, measured on a real suite.
Cloud review tools: **your code leaves**	**Zero egress**: tests run with no network.
Review notes: **expire with the thread**	**Six receipts** that replay offline.

Measured on demo/workspace: 3 tests, 1.6 s, exit 0 — the run in demo/runs/20261031T041126Z

Boring on purpose.

Nothing here needs a research breakthrough to work.

Delivery layer

LangGraph orchestrates four agents; Docker or Firecracker executes each cycle.

Data and payment

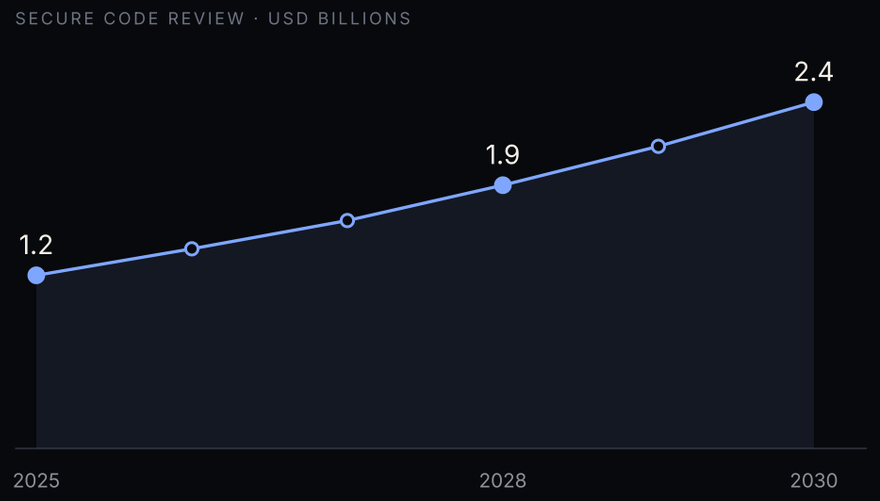

LiteLLM routes inference; GNAP signs every cycle into the Git history.

IP status

No patent filed. The guard and the published audit are the moat.

The budget is real. Here is the math.

Two anchors published, four years interpolated at the same rate.

● Published 2025 and 2030 ○ Same 14.9% CAGR applied

2,500	regulated organisations
× 500	developers each
× $360	per developer, per year

$450M we can sell into

That is 37% of the $1.22B category — the regulated half. We quote the smaller number.

Mordor Intelligence, Secure Code Review Platforms Market: USD 1.22B (2025) to USD 2.44B (2030), 14.88% CAGR · four years interpolated

Three outcomes, all arithmetically possible.

Every figure below is accounts × $180k, against the $450M we can sell into.

Best case

The default gate. **1,500 accounts**, 60% of the segment.

$270M ARR

Realistic

5% of 2,500 organisations. **120 accounts**.

$21M ARR

Worst case

A 10-person service in one sector. **15 accounts**.

$2.7M ARR

No revenue today. These are outcomes of the pricing hypothesis, not a forecast.

Two channels, one loop.

We do not buy developer attention. We give away the proof.

Design partners

Platform and AppSec leads at 200–5,000-developer firms. **Founder-led**, three at a time.

Shareable receipts

Every verified cycle produces a signed artifact. **The artifact is the ad.**

A receipt names the repo, the suite, the exit code and the hash. It travels further than a landing page.

Four months, four checkpoints.

Everything below is in the repository, with the commit that produced it.

OCT 2026

License audit passes; proprietary tree clean.

OCT 2026

Four-tier loop ships, 30/30 tests green.

31 OCT 2026

Six verified runs, three on a free route.

NOV 2026

Pricing set; demo and proof pack shipped.

Raising $750K · 18 months · three paid pilots · PROOF_STATUS.md lists 15 of 36 capabilities as verifiable
