INDEX0 AI

PRE-SEED · NOVEMBER 2026 · INDEX0 AI INC.

Own your AI engineer. A self-hosted, multi-agent AI software engineering platform. You ask for code in your terminal, editor or browser; four agents plan, patch and critique it; the last one **executes it** against the repository's own test suite in a network-isolated container. Nothing merges until it runs — on your infrastructure, with your model key.

Surfaces

- **Terminal** — the `index0` CLI and TUI: `run`, `plan`, `review`, worktrees. 37 tests.
- **Editor** — VS Code extension, 7 commands including GhostText and GNAP diff review. 4 tests.
- **Browser** — React workbench and the portal at `ai.index0.in`. 94 tests.

Problem

90% of developers use AI at work (DORA 2025) and 45% of the code it writes ships an OWASP flaw (Veracode 2025). The assistants that write it live in their own cloud and stop at the diff; the reviewer still reads 400 lines an hour, and the regulated buyer is told to send source out and rent a seat forever.

Product

- Developer output is whole files (models are bad at hunk arithmetic); the unified diff is derived by us.
- QA copies the repo into a container with `--network none`, writes the candidate, runs `npm test`, reports the exit code and the counts the runner printed.
- Candidate edits to test files are dropped, so the assertions that decide the verdict are always the repository's own. Every cycle is hash-chained (GNAP).

Proof (we audited ourselves first)

- **15 of 36** claimed capabilities verifiable today — listed line by line in `PROOF_STATUS.md`, shipped in the repo.
- **0 of 3** published benchmarks. The old 96.2% SWE-bench / 92% AiderBench numbers were unverified and removed.
- **30/30** orchestrator tests, 14 sandbox-manager, full monorepo build, all green in CI.
- Six committed end-to-end runs: `qa_verified`, exit 0. Three on a free model route, 1.2–1.7 s each.

Market

AI code tools: $9.8B (2026) → $26.0B (2030), 27.1% a year (Grand View Research; GVR names on-premises the fastest-growing deployment segment, driven by data-sovereignty rules). Our slice: 2,500 regulated orgs × 500 developers × $240 = **$300M**, at our $20/seat/month price. Buyer: 200–5,000 developers in finance, healthcare and government who cannot send source to a vendor cloud.

Ask

$750K pre-seed over 18 months to turn a working platform into three paid pilots whose replayable artifacts survive a real audit. Two hires (sandbox infrastructure, security), founder-led GTM, SOC 2 Type I. Inference runs on the customer's model contract, so COGS look like software. Live demo: `./demo/run-demo.sh` — ~7 s warm, no paid API.
